

# Ring Main Productivity

RETICULATES HIGH PRESSURE HOT WATER AROUND THE WINERY

Larger processors have been installing centralised cleaning systems to cater for increasing demand on their high pressure wash down and sanitisation capability.

Typically a dedicated plant room houses the high pressure pump station and hot water service while a Ring-Main reticulates high pressure hot water around the winery.

A Ring-Main consists of a network of quick release take-off points strategically positioned around the facility. All the operator has to do is quick-connect a wash down hose, gun and lance and turn on the supply.

A Ring-Main can easily be expanded with more take-offs, retractable hose reels and can be configured for single or multi-user application to further improve productivity.

Processors who have moved this way recognised the inefficiencies of dragging industrial pressure cleaners around to where it's needed next. Not to mention a strong desire to keep diesel fumes out of the production area for health and safety reasons.

A centralised cleaning system not only affords the opportunity to cater for multiple users working from the

same supply, they can make a big difference to productivity in a busy facility.
