NATURAL CLIMATE
PROTECTION

CropBioLife is an activated foliar spray containing flavonoids. The flavonoids delivered to the leaf stimulate the plants natural production of phenolic compounds critical to the plant's performance and energy.

STRESS RELIEF!

Flavonoids protect plants from different biotic and abiotic stresses and act as unique UV-filter, function as signal molecules. They act as compounds to influence the germination, growth, survival, and reproduction of plants. They are phytoalexins, detoxifying agents and antimicrobial defensive compounds.

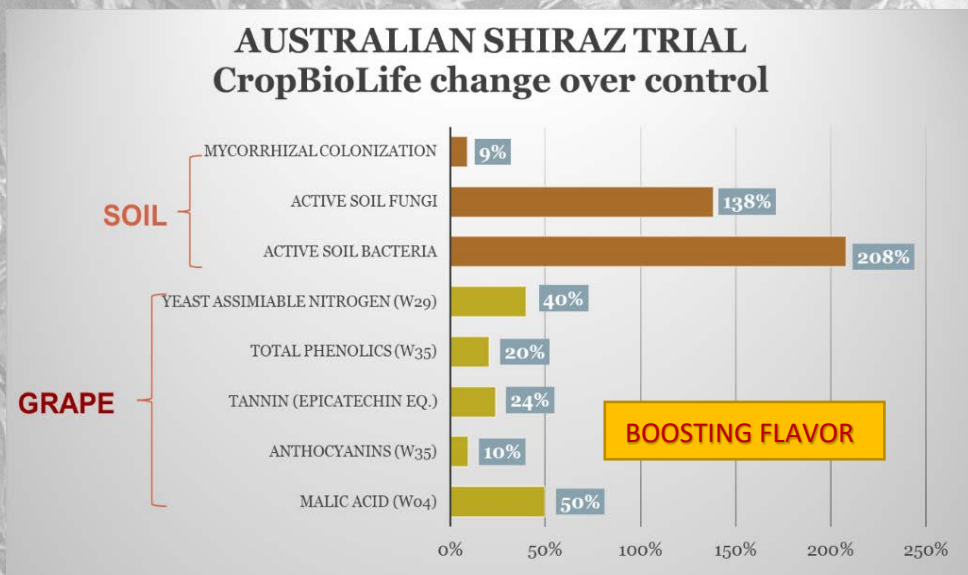

Flavonoids are polyphenolic secondary metabolic compounds, universally distributed in the green plant kingdom and are located in cell vacuoles.

Flavonoids play a variety of biological activities in plants, animals, and bacteria. In plants, flavonoids have long been known to be synthesized in particular sites and are responsible for colour, aroma of flowers & fruit, attract pollinators and fruit dispersion; help in seed, spore germination as well as growth and development of seedling.

Flavonoids have roles in frost hardiness, drought resistance and may play a functional role in plant heat acclimation and freezing tolerance.

CropBioLife enhances the processes responsible for soil interaction that improves the health of the soil ecosystem around the root mass. This leads to better plant available nutrition for the plant to take advantage of.
